Your need for baseball caps is gone! Artificial cheating is the wave of the future!

While some doubters of AI technology may find the future difficult to swallow, a new study shows that artificial cheating already surpasses 99% of individuals in its ability to cheat.

In a classroom experiment where every student received a pen that broadcasts their answers to an AI, the AI cheated better than 99% of the human cheaters.

“This is the wave of the future!” said CheatBot CEO Mel Quedry. “Wearing a baseball cap to hide where you are looking during a test is a thing of the past! With CheatBot 1.0 on your smartphone, you can see everyone’s answers all at once and let the AI sort through them to give you the best real-time answers!”

When this reporter asked whether there might be a problem if everyone uses CheatBot and no one does homework anymore, the CEO answered:

“No problem, no problem! Our market is expanding exponentially, so we always have a fresh edge of new people who haven’t woken up and learned that cheating is way easier. They still do the homework, and we get to steal it!”

When I observed that this sounded unsustainable, Mel replied:

“Again, no problem! There are billions of suckers — people, I meant to say people — in this world, so we can expand forever! CheatBot tells us that a great mathematician named Ponzi worked this out for us years ago!”
