

[page start 2147]

calculation, unrecognized as such, of the variable-width Boltzman fabric of the now.] Could a thicker BFOTN be stiffer, causing gravity to fall off more slowly? This fact would result in both testable predictions -- gravity falling off ^{← type TB "off"} more slowly in "low matter / low into" regions of space -- and perhaps linkages to the duration of the universe, as speculated by the originator of MOND.
