- The non-complex plane is the plane of rotation - that is of angular momentum, which is always conserved. That is, the formation of ~~the~~ rotation in the 4D space requires the simultaneous formation of an equal and opposite ~19:05 (Marshall-StonetrIDGE park)

- But this also applies for mass (complex plane) spins!
- Anti-matter thus is not the "real" antimatter - its complex spins are in the same direction as ordinary matter, with the "gyrating" of the rotation plane relative to the complex plane reversed. (E.g., a mirror-image quaternion)
- There is no name or prefix for true, negative energy matter with reversed complex plane spin. With apologies to Monty Python, I'll create a prefix "nee", negative energy, to describe this form. Nee-matter + matter = zero energy, versus anti-matter + matter = same total quantity of matter as before.
- Assuming (?) the reversal to reverse the direction of the time (read) complex plane coordinate, this gives two identical-in-all-ways (more than antimatter) universes, regular and nee-universe, repelled away from each other at twice the speed of light, and summing to a mass of zero.
